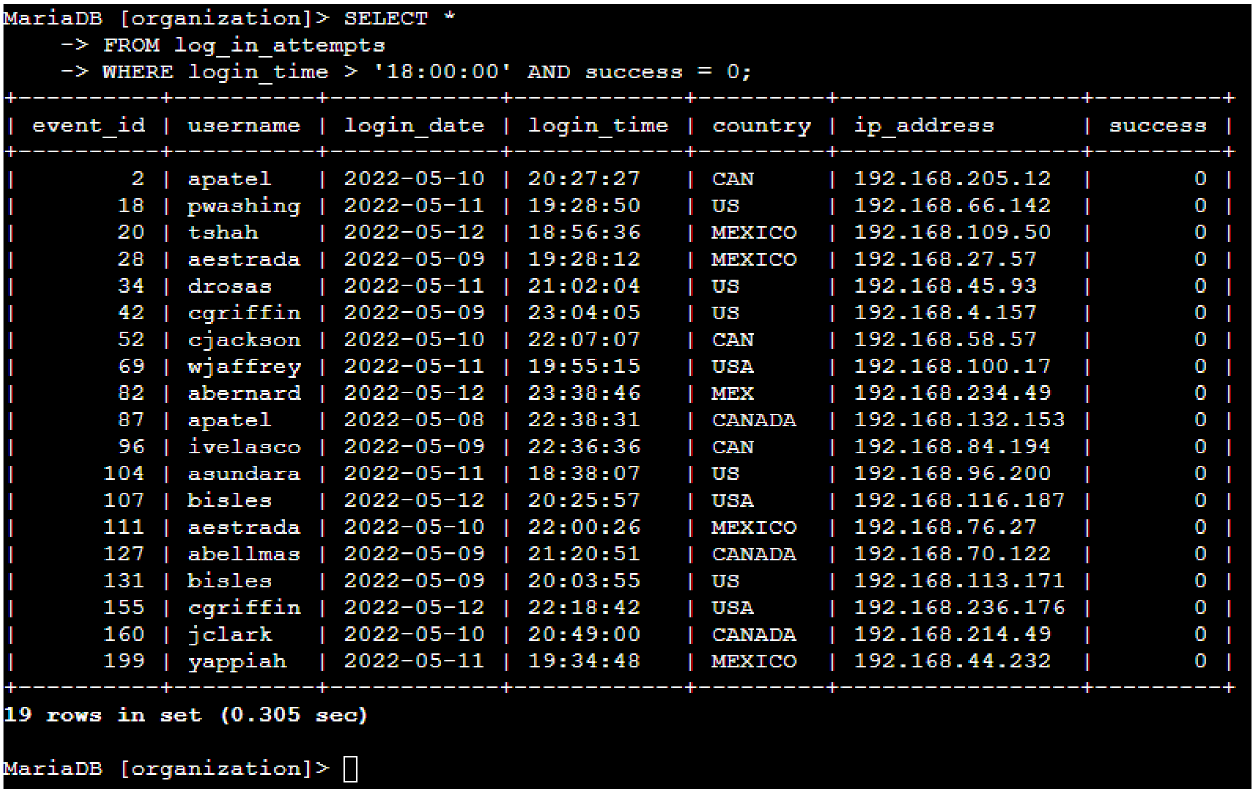
Apply filters to SQL queries

Project description

In this project an organization needed a security analyst to use SQL to query a MariaDB. These queries were used to investigate security incidents, perform audits, and run reports on which employee PC's need updating. The following descriptions and screenshots will demonstrate how this was accomplished.

Retrieve after hours failed login attempts

The organization reported a potential security incident that occurred outside of normal logon hours. Employees usually log out at 6pm (18:00). I used the following query shown in the screenshot to audit the failed login attempts that occurred after 18:00. In the "success" column 0 (zero) indicates a failed login attempt.



```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_time > '18:00:00' AND success = 0;
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |

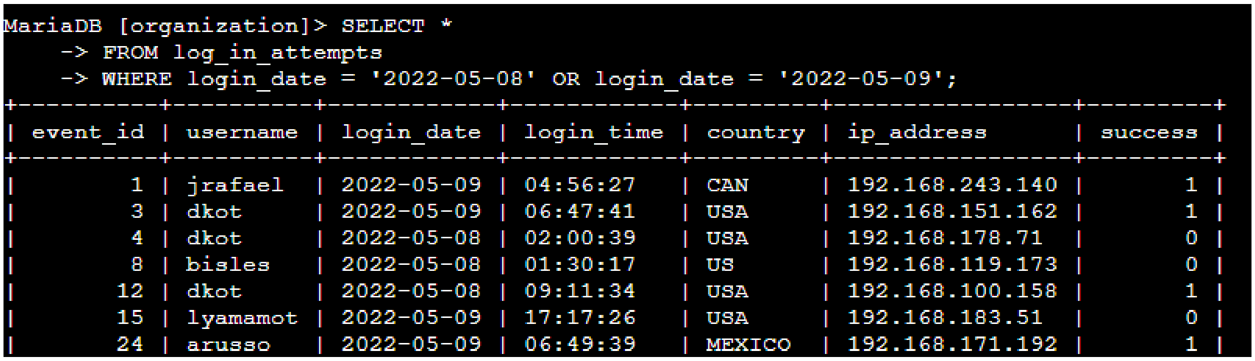
19 rows in set (0.305 sec)

MariaDB [organization]> 
```

All queries used in this project begin with SELECT * to indicate the output returned should be from all columns in the table asked for in the FROM line. It can be seen that I used FROM to select the “log_in_attempts” table, then WHERE to filter the output to only be attempts after 18:00. Finally I added the AND operator to add the filter of only failed attempts.

Retrieve login attempts on specific dates

It was reported that a suspect even occurred between two days, 2022-05-08 and the following day 2022-05-09. The following screenshot shows the SQL query used to audit the logs from the database for these dates.

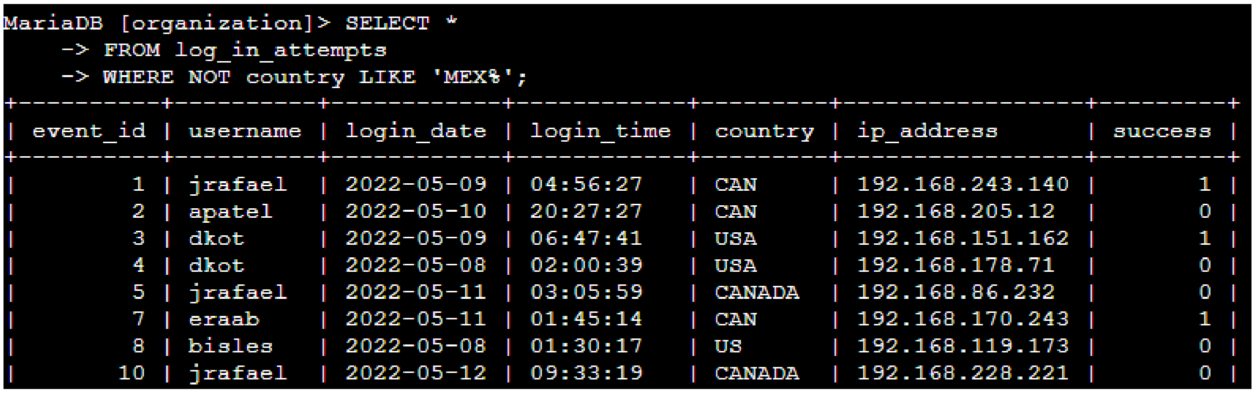


```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE login_date = '2022-05-08' OR login_date = '2022-05-09';
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |
+----------+----------+------------+------------+---------+-----------------+---------+
|        1 | jrafael  | 2022-05-09 | 04:56:27   | CAN     | 192.168.243.140 |       1 |
|        3 | dkot     | 2022-05-09 | 06:47:41   | USA     | 192.168.151.162 |       1 |
|        4 | dkot     | 2022-05-08 | 02:00:39   | USA     | 192.168.178.71  |       0 |
|        8 | bisles   | 2022-05-08 | 01:30:17   | US      | 192.168.119.173 |       0 |
|       12 | dkot     | 2022-05-08 | 09:11:34   | USA     | 192.168.100.158 |       1 |
|       15 | lyamamot | 2022-05-09 | 17:17:26   | USA     | 192.168.183.51  |       0 |
|       24 | arusso   | 2022-05-09 | 06:49:39   | MEXICO  | 192.168.171.192 |       1 |
```

Again FROM is used to select the “log_in_attempts” log. This time WHERE is used to filter dates between the two dates provided. The OR operator is used to tell the database to report both dates.

Retrieve login attempts outside of Mexico

The organization determined the login attempts from Mexico were not the issue. In the following query I refined the SQL query to exclude any login attempts from the country of Mexico.

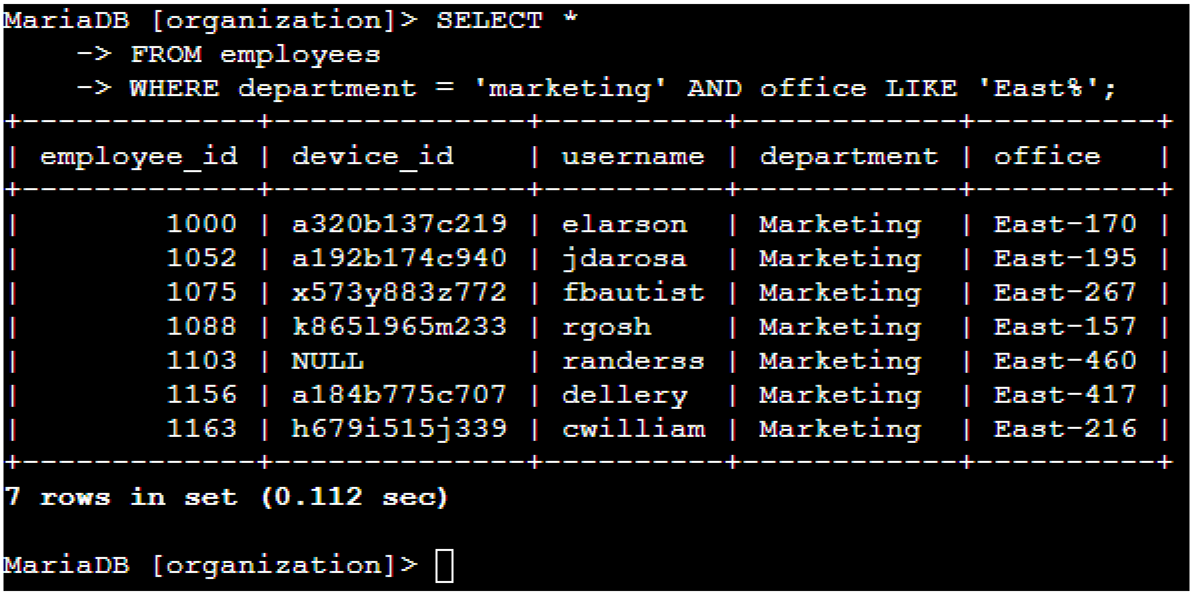


```
MariaDB [organization]> SELECT *
    -> FROM log_in_attempts
    -> WHERE NOT country LIKE 'MEX%';
+----------+----------+------------+------------+---------+-----------------+---------+
| event_id | username | login_date | login_time | country | ip_address      | success |
+----------+----------+------------+------------+---------+-----------------+---------+
|        1 | jrafael  | 2022-05-09 | 04:56:27   | CAN     | 192.168.243.140 |       1 |
|        2 | apatel   | 2022-05-10 | 20:27:27   | CAN     | 192.168.205.12  |       0 |
|        3 | dkot     | 2022-05-09 | 06:47:41   | USA     | 192.168.151.162 |       1 |
|        4 | dkot     | 2022-05-08 | 02:00:39   | USA     | 192.168.178.71  |       0 |
|        5 | jrafael  | 2022-05-11 | 03:05:59   | CANADA  | 192.168.86.232  |       0 |
|        7 | eraab    | 2022-05-11 | 01:45:14   | CAN     | 192.168.170.243 |       1 |
|        8 | bisles   | 2022-05-08 | 01:30:17   | US      | 192.168.119.173 |       0 |
|       10 | jrafael  | 2022-05-12 | 09:33:19   | CANADA  | 192.168.228.221 |       0 |
```

Again FROM is used to choose the “log_in_attempts” table. This time WHERE is paired with the NOT operator which is applied to the country column followed by the LIKE operator using ‘MEX%’, “%” being a wild card that will return any text beginning with MEX as some entries could be Mex, some could be the full word Mexico.

Retrieve employees in Marketing

The organization asked for a report on machines in the Marketing department in the eastern buildings. These machines needed to be updated. In the following screenshot I’ll explain the query I ran with SQL to retrieve this info.



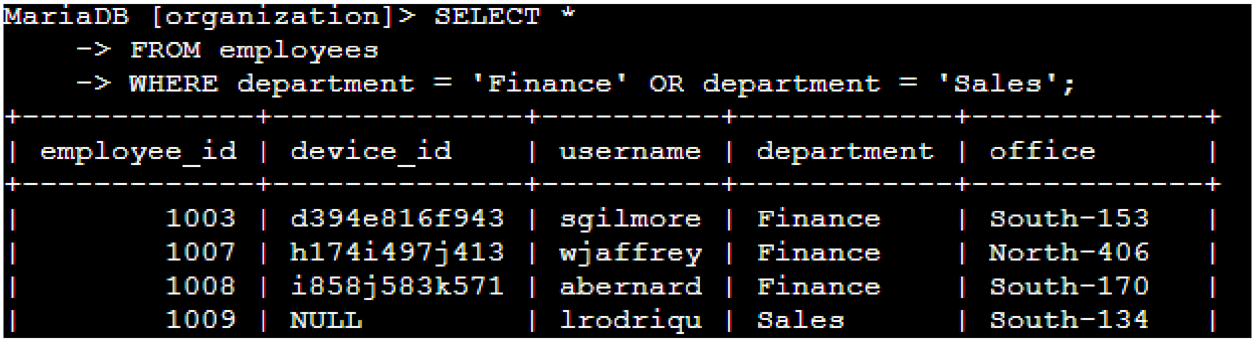
```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'marketing' AND office LIKE 'East%';
+-------------+---------------+----------+------------+----------+
| employee_id | device_id     | username | department | office   |
+-------------+---------------+----------+------------+----------+
|        1000 | a320b137c219  | elarson  | Marketing  | East-170 |
|        1052 | a192b174c940  | jdarosa  | Marketing  | East-195 |
|        1075 | x573y883z772  | fbautist | Marketing  | East-267 |
|        1088 | k8651965m233  | rgosh    | Marketing  | East-157 |
|        1103 | NULL          | randerss | Marketing  | East-460 |
|        1156 | a184b775c707  | dellery  | Marketing  | East-417 |
|        1163 | h679i515j339  | cwilliam | Marketing  | East-216 |
+-------------+---------------+----------+------------+----------+
7 rows in set (0.112 sec)

MariaDB [organization]> 
```

This time FROM is used to choose the “employees” log in the database. Next WHERE is used to filter the department column to just marketing, the AND operator is used to filter the office column for any entry LIKE “East%”, using % to indicate that any entries beginning with East should be returned.

Retrieve employees in Finance or Sales

It was then reported that machines in the Finance and Sales departments need to be updated as well. I used the following SQL queries to do so.

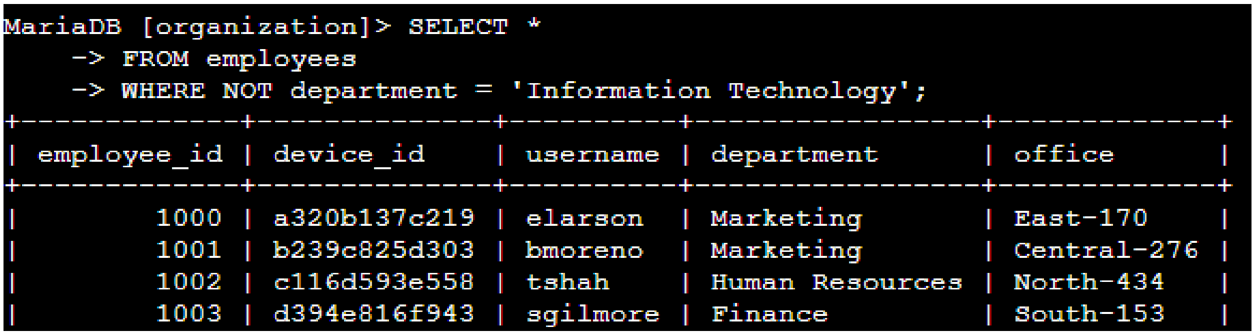


```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE department = 'Finance' OR department = 'Sales';
+-------------+--------------+----------+------------+-------------+
| employee_id | device_id    | username | department | office      |
+-------------+--------------+----------+------------+-------------+
|        1003 | d394e816f943 | sgilmore | Finance    | South-153   |
|        1007 | h174i497j413 | wjaffrey | Finance    | North-406   |
|        1008 | i858j583k571 | abernard | Finance    | South-170   |
|        1009 | NULL         | lrodriqu | Sales      | South-134   |
```

Again FROM is used to select the “employees” log. This time WHERE is used to sort for employees in the Finance, OR the sales department. The OR operator is used to indicate to the database that it should return both entries.

Retrieve all employees not in IT

All employees outside of the IT department needed an additional security update. I used the following SQL query to retrieve the list of machines that need this update.



```
MariaDB [organization]> SELECT *
    -> FROM employees
    -> WHERE NOT department = 'Information Technology';
+-------------+--------------+----------+-----------------+-------------+
| employee_id | device_id    | username | department      | office      |
+-------------+--------------+----------+-----------------+-------------+
|        1000 | a320b137c219 | elarson  | Marketing       | East-170    |
|        1001 | b239c825d303 | bmoreno  | Marketing       | Central-276 |
|        1002 | c116d593e558 | tshah    | Human Resources | North-434   |
|        1003 | d394e816f943 | sgilmore | Finance         | South-153   |
```

SELECT * is used, like in all other examples shown, to choose all columns in the table. The “employees” database log is chosen using FROM. Lastly, WHERE is modified by the NOT operator to filter for all departments except Information Technology.

Summary

I used multiple SQL commands and operators to filter information from two tables in a database to complete security research, security audits, and update audits to achieve the organization's goal.
